Housing Markets

Signs of a housing market rebound have begun to accumulate. Rental demand was up and vacancies down in 2011, leading to a jump in multifamily construction. With the economy steadily adding more jobs, home sales picking up, and new home inventories at record lows, the single-family market may also be reviving. Still, the persistent weakness in existing home prices, the large backlog of foreclosures, and the tight lending environment are restraining the recovery.

MARKETS AT A TURNING POINT

While multifamily starts surged 54 percent and home improvement spending eked out a 0.6 percentage-point gain, single-family starts dropped some 8.6 percent last year (**Figure 8**). Because of the lag between starts and finished construction, completions of both single- and multifamily homes were also off more than 10 percent, falling to record lows. Even manufactured home placements plumbed new depths in 2011, at just 47,000 units. The sharp and sustained retreat made 2011 the worst year for completions in records dating back to 1968.

But the beleaguered single-family market now appears to be turning around, with starts picking up significantly in the second half of 2011 and standing 16.6 percent above weak year-earlier levels in the first quarter of 2012. Permitting, a leading indicator of starts, was also up 16.9 percent early this year. With homebuilders reporting strong growth in orders and new home sales, residential construction activity appears to be emerging from the deepest, most prolonged downturn in recent history.

Indeed, despite the spectacular boom early in the decade, 2002–11 was the worst 10-year period for overall housing production since recordkeeping began in 1974. Moreover, this cycle marks the only time in the post-WWII era that starts dipped below 1.0 million units a year and then rebounded so weakly (**Figure 9**). Making matters worse, the fall-off in demand was even more dramatic than the plunge in housing production, leaving national vacancy rates at elevated levels.

The downturn in remodeling has also been sharp and prolonged, although not nearly as severe as in homebuilding. After a peak-to-trough drop of 28.4 percent (compared with more than 75 percent in new construction spending), home improvement spending increased to 49 percent of residential construction expenditures in 2011. This is the largest share in records dating back to 1993 and well above the 25 percent averaged in 1993–2008. Although real expenditures on improvements were down 1.6 percent in the first quarter of 2012 from year-earlier levels, the Joint Center's Leading Indicator of Remodeling Activity points to a resumption of spending growth in the second half of 2012. Investment in lender-owned properties should also help to prop up remodel-

eling expenditures in the coming year as banks and other institutions prepare foreclosed units for the market. For example, last year Fannie Mae alone spent \$557 million on repairs to about 89,800 of its foreclosed properties.

IMPROVING HOME SALES

After hitting a record low of just 306,000 in 2011, sales of new homes in the first quarter of 2012 stood 16.7 percent above year-earlier levels. While the increase occurred from record lows, new home sales appear to be staging a recovery that, for the first time in this cycle, does not depend on the temporary stimulus of federal homebuyer tax credits. In addition, homes are selling more quickly. The typical new home for sale in March 2012 was on the market for just 8.0 months, compared with 8.7 months in March 2011 and 14.4 months in March 2010.

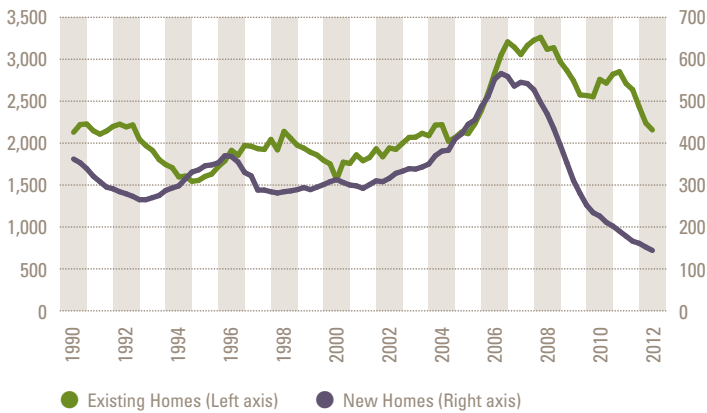

Existing home sales show a similar trend. The National Association of Realtors® (NAR) reports that sales of single-family homes and condominiums increased just 1.7 percent, to 4.3 million, in 2011 as a whole but accelerated in the second half of the year. By the first quarter of 2012, existing home sales were 5.2 percent above year-earlier levels.

Underscoring the impact of tight credit conditions on homebuyers as well as increased investor interest in distressed properties, cash purchases made up 30 percent of existing home sales last year. The share of sales to first-time homebuyers fell to 33 percent in

2011, down from 39 percent in 2010 when federal tax credits were still available. Even so, the number of first-time buyer sales managed to slowly but steadily rise from mid-2010 lows.

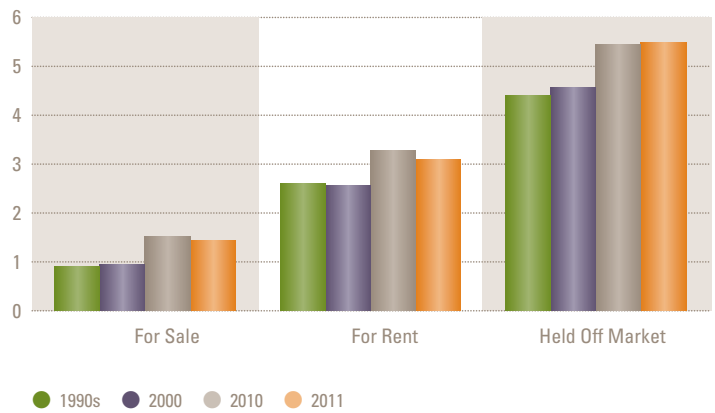

HIGH "OFF-MARKET" INVENTORIES

Inventories of new single-family homes for sale fell 20 percent in 2011, sinking to just 143,000 units in March 2012—the lowest level in nearly five decades of recordkeeping. Even with the feeble pace of new home sales, this level of inventory equates to less than a 6.0 months' supply for the first time in more than five years. The inventory of existing homes for sale also shrank by some 23 percent in 2011, reducing the supply in the first quarter of 2012 to 6.2 months—also the lowest level since 2006. The 6.0-month supply mark is important because it is considered a rough indicator of market balance, where neither buyers nor sellers have the upper hand in price negotiations.

Despite this depletion of the for-sale stock, the inventory of vacant units held off market continued to grow last year (**Figure 10**). This excess supply is of concern because of its potential drag on the housing recovery. According to the latest Housing Vacancy Survey, the number of vacant units held off the market rose in 2010–11, partially offsetting declines in the numbers of "on-market" vacant homes for rent and for sale. Units held off market now account for 5.5 percent of the housing stock—nearly a full percentage point more than in 2000–2. This increase implies that, relative to that period, there are more than 1.2 million excess off-market vacant units. When these units come on the market, they could exert even more downward pressure on home prices. For now, though, the decline in vacant units for

sale is helping to put a bottom under prices, while the decline in vacant units for rent has begun to spark rent increases in many markets.

LAGGING HOME PRICES

After another bad year for home prices, the first glimmers of a turnaround began to appear by the first quarter of 2012. The median new single-family home sold for \$227,200 in 2011, down 0.7 percent in real terms from 2010 to a new cyclical low. Based on the Census Bureau's constant-quality adjusted new home price index, however, real prices fell 3.8 percent—suggesting that similar homes sold for significantly less in 2011 than in 2010. By this measure, real price declines accelerated as the year progressed, ending the fourth quarter 5.5 percent lower than a year earlier.

Existing home prices also showed renewed weakness for much of 2011 after stabilizing in 2010. Nationwide, both the S&P/Case-Shiller Home Price Index and NAR's median price dropped at least 4.0 percent in nominal terms to new cyclical lows in 2011. The Freddie Mac House Price Index indicates that the declines were widespread, reaching 328 (90 percent) of the 364 metropolitan areas covered. Indeed, home prices in fully 307 (84 percent) of these metros were also at new lows last year. As a result, home values in most metropolitan areas have retreated to pre-boom levels, erasing more than 15 years of appreciation in some cases (**Figure 11**).

Price declines at the low end of the market were especially severe. Among the 16 metros covered by the S&P/Case-Shiller index, prices for bottom-tier homes plummeted an average of
